The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number

inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

Retroviral recombination assays, systems and cells, useful for evaluating the risk of producing a replication-competent retrovirus from a retroviral-based vector.

Example 5; Fig 14; 88pp; English.

The present invention describes a method for detecting a retroviral genetic recombinant having gag and pol functions, involving a cell suspected of having a recombinant and propagating the recombinant in the presence of any necessary helper functions. This is useful as it enables the detection of vectors which are able to replicate in the host cell, and allows the production of vectors suitable for gene therapy. The present sequence is a DNA fragment used to demonstrate the method of the invention

```
selectively binds to a protein of a breast cancer marker gene is useful for treating cancers, particularly breast cancers. The host cell of the invention is useful for producing non-human transgenic animals. This polymucleotide sequence represents one of the breast cancer marker genes of the invention

The invention relates to an isolated polypeptide encoded by a breast cancer marker gene comprising any of 1417 21-805 nucleotide sequences, given in the specification. The methods of the invention are useful for diagnosing patients having an identified breast mass or symptoms associated with breast cancer, to diagnose breast cancer or its precursors, and for monitoring the efficacy of treatment of a breast cancer patient (e.g. efficacy of chemotherapy). The methods are also useful for evaluating a patient before, after or during therapy, to evaluate the reduction in a two-outen. The breast cancer marker gene proteins are useful as immunogens for raising antibodies, by immunising a mammal with a breast cancer marker proteins are useful as bait proteins in two-hybrid or three-hybrid assay, to identify other proteins in two-hybrid or interact with the marker proteins. The breast cancer marker genes are useful as surrogate marker proteins. The breast cancer marker genes are useful as surrogate marker genes for one or more disorders, disease states or conditions leading to disease states, in particular, breast cancer marker genes. An antibody which

differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product in a cest sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 548 polymucleotide sequences given in AA21253 to AA217779. The polymucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymuchophisms. Polypeptides encoded by the polymucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polymucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an exceptible of a genetic predisposition or susceptibility to a disease such as cancer). The polymucleotides of the invention are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polymucleotides can also be used to screen for peptide analogues and antagonists

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibit ing prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                     67

                                                                                                                                                                                                                                                          The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to yrtokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymetides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or resament of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present invention relates to the isolation of novel DNA-binding proteins (AAU18154-AAU18281), and cDNA and genomic sequences encoding for these proteins. DNA-binding proteins such as histones, droromo (chromatin organisation modifier) domain proteins, and Y-box binding proteins may contribute to diseases resulting from aberrant DNA organisation and/or gene transcription. The sequences of the invention are useful in screening assays to identify antagonism and/or agoing assays to identify antagonism and/or agoinsts that may enhance or block activities mediated by DNA-binding proteins. Blockers of DNA-binding proteins may be useful in treating disorders such as malignant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid molecules encoding human secreted chromosomal binding proteins, used in preventing, treating or ameliorating a disorder, e.g. Alzheimer's and Parkinson's diseases and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 4; SEQ ID NO 30; 561pp; English

diseases (e.g. cancer), autoimmune disorders (e.g. diabetes mellitus), rheumatic diseases (e.g. rheumatoid arthritis), genetic abnormalities (e.g. cystic fibrosis), infectious diseases (e.g. HIV) and neurological disorders (e.g. Alzheimer's disease). The polymucleotide sequences of the invention may also be used in gene therapy. AAS29030-AAS29157 represent sequences encoding for novel DNA-binding proteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                              Human, DNA-binding protein, B cell immunodeficiency, autoimmune disorder, severe combined immunodeficiency; rheumatoid arthritis; Crohn's disease, diabetes mellitus, allergy; asthms; inflammatory condition; thrombosis; graft-versus-host disease; blood-related disorder; atherosclerosis; hyperproliferative disorder; cancer; renal disorder; arrhythmia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           hyperproliferative disorder; renal disorder; arrhythmia; acute glomerulonephritis; cardiovascular disorder; respiratory disorder; golomerulonephritis; cardiovascular disorder; respiratory disorder; goodpasture's syndrome; neurological disorder; Alzheimer's disease; Parkinson's disease; endocrine disorder; Addison's disease; gene; reproductive system disorder; endometrisals; infections disease; viral infection; bacterial infection; fungal infection; vaccine; gastrointestinal disorder; multiple sclerosis; gene therapy; ss.

Novel DNA-binding protein useful for diagnosis, prognosis, prevention and treatment of immune, hyperproliferative, respiratory, cardiovascular, reproductive, endocrine, gastrointestinal and neurological disorders.

Claim 1; SEQ ID NO 30; 225pp; English.

The present invention relates to a new DNA-binding protein. The invention is useful in treating, preventing, diagnosing and/or prognosing immunodeficiencies (severe combined immunodeficiencies), autoimmune disorders (theumatoid arthritis, multiple sclerosis, diabetes mellitus), allergic reactions and conditions (e.g. cathma), inflammatory conditions, graft-versus-host disease, blood-related disorders (thromosis, atherosclerosis), hyperproliferative disorders (e.g. cancer), renal disorders (e.g. acute glomerulomephritis), cardiovascular disorders (e.g. arrhythmia), respiratory disorders (Goodpasture's syndrome), neurological disorders (e.g. Alzheimer's (Goodpasture's syndrome), neurological disorders (e.g. Alzheimer's disease), reproductive system disorders (e.g. endometricsis), infectious disease), reproductive system disorders (e.g. endometricsis), infectious disease), reproductive system disorders (e.g. endometricsis), infectious disease), reproductive system disorders (e.g. endometricsis), infectious disease), reproductive system disorders (e.g. cohn's disease). The invention is also cuseful to stimulate neuronal growth and treat, prevent, and/or diagnose neuronal damage which occurs in certain neuronal disorders or neuro-capes minding protein of the invention. Note: The sequence encodes a human DNA-binding protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was cobtained in electronic format directly from USPTO at

```

The invention relates to an isolated nucleic acid molecule (CDNA)

c accoding a human extracellular matrix protein, representing one of 161

c novel genes. Also included are recombinant vectors, host cells

c novel genes. Also included are recombinant vectors, host cells

c novel specially, the extracellular matrix proteins (including their fragments, epitopes and homologues), an isolated antibody that binds specifically to the protein, diagnosing a pathological condition or susceptibility to a pathological condition in the nucleic acid and diagnosing a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or control or amount of expression of the protein in a biological sample and diagnosing a condition based on the protein to a mamunian subject, identifying a binding partner to the protein to a mammalian subject, identifying a binding partner to the protein, the gene corresponding to the cDNA sequence, and identifying an activity in a biological assay (comprising expressing the nucleic acid in a cell, isolating the supernatant, detecting an activity in a biological Claim 1; SEQ ID NO 30; 226pp; English.

(I) is useful for: (a) assessing whether progression of prostate cancer; (b) monitoring the progression of prostate cancer; (b) monitoring the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) assessing the prostate cancer in a patient; (f) assessing the prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                        65
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, prostate cancer, cytostatic, carcinogen, pharmacodyanamic marker, pharmacogenomic marker, gene, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.

                                                                                                                                                                                                                           Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokins, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hamatopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                       73
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, cytokine, cell proliferation, cell differentiation, gene therapy, vaccine, peptidd therapy, stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation; ss.

The Invention relates to a pullitue increase and increation or muscle and fat deposition (designated IMPD), derived from cattle, and the IMPD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 1812 nucleotide sequences, appearing as ABX48836-ABX49847, or complements of them. Also included are it. It atransformed cell having a nucleic acid comprising an IMPD nucleic acid linked to a promoter and a 3 non- translated sequence that functions in the cell having a nucleic acid comprising an IMPD nucleic of polyadenylated ribonucleotides to a 3 end of the MRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising. (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridiaation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b)

and immunostimulants; and a polypeptide (II) of a ovarian tumour polypeptide encoded by a polynuclectide (III) having a cDNA sequence (S1) from the 10912 nuclectide sequences as given in ABL77023 to ABB47934, (III) encoding (II) having a sequence (S2), a T cell population of (II), or antigen presenting cells that express (II). (I) has cytostatic activity. An oligonuclectide (IV) that hybridises to (S1) can be used for
detecting the level or pattern of the complementary nucleic acid, where the detection of the complementary nucleic acid is predictive of the level or pattern of the molecule. The LMFD nucleic acid is used for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the 15112 bovine LMF EST (expressed sequence tag) nucleic acids. Note: The present sequence was not shown in the specification but was obtained in electronic format from the USPTO web site:
                                                                                                                                                                                                                                                                                                                                              130
                                                                                                                                                                                                                                                                                                             95

progression of prostate cancer in a patient; (c) assessing the efficacy

```
serum or ovarian tissue. The method comprises contacting a biological sample from a patient with (IV), detecting the amount of polymuclectide hybridising to (IV) and comparing the amount to a predetermined cutoff value and thereby detecting ovarian cancer in the patient, where the amount of polymuclectide hybridising to (IV) is detected preferably by polymerses chain reaction (PCR). (I) comprising (III) and/or [II] is useful for stimulating and/or expanding T cells specific for an ovarian tumour protein comprising contacting T cells specific for an ovarian tuseful in design and preparation of ribosyme molecules for inhibiting expression of the tumour polypeptides and proteins in tumour cells; and to isolate a full length gene from a suitable library e.g., a tumour cDNA library using well known techniques

Schlegel R, Endege WO,

Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.

Claim 1; Page 10500; 11750pp; English

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV6010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the ABSULT 13

(I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy
           of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker.
                                                                                                                                                                                                                                                                                                  61

(I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing
of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has mecastabized in a patient; (d) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                73

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Description

Sequence 27, Application US/09018584A
Patent No. 623863
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Schumm, James W.
APPLICANT: Bacher, Jeffery W.
TITLE OF INVENTION: MATERIALS AND METHODS FOR
TITLE OF INVENTION: REPEAT DNA MARKERS
NUMBER OF SEQUENCES: 147
CORRESPONDENCE ADDRESS:
ADDRESSE: Promeça Corporation
STREET: 2800 Woods Hollow Road
                                                                                                                             COUNTRY: USA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ଚ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1. 6297003
Patent No. 6297003
GENERAL INFORMATION:
APPLICANT: Rice, Charles M.
APPLICANT: ROLVKhalov, Alexander A.
APPLICANT: ROLVKhalov, Alexander A.
TITLE OF INVENTION: NOVEL 3' TERMINAL SEQUENCE OF HEPATITIS
TITLE OF INVENTION: C VIRUS GENOME AND DIAGNOSTIC AND THERAPEUTIC USES THEREOF
NUMBER OF SEQUENCES: 39
CORRESPONDENCE ADDRESS:
ADDRESSE: Howell & Haferkamp, L.C.
STREET: 7733 Forsyth Blvd., Suite 1400
CITY: E. Louis

Sequence 22, Application US/08897126
Patent No. 6297003
GENERAL INFORMATION:
APPLICANT: Rice, Charles M.
APPLICANT: ROLPHALOV. Alexander A.
APPLICANT: ROLPHALOV. Alexander A.
TILE OF INVENTION: C VIRUS GENOME AND DIAGNOSTIC AND THERAPEUTIC USES THEREOF NUMBER OF SEQUENCE. 3 39
CORRESPONDENCE ADDRESS:
ADDRESSE: Howell & Haferkamp, L.C.
                                                                 APPLICANT: Rice, Charles M.
APPLICANT: Kolykhalov, Alexander A.
TITLE OF INVENTION: NOVEL 3' TERMINAL SEQUENCE OF HEPATITIS
TITLE OF INVENTION: C VIRUS GENOME AND DIAGNOSTIC AND THERAPEUTIC USES THEREOF
NUMBER OF SEQUENCES: 39
